Neuroglia

Neuroglia, also called glial cell or glia, any of several types of cell that function primarily to support neurons. The term neuroglia means “nerve glue.” In 1907 Italian biologist Emilio Lugaro suggested that neuroglial cells exchange substances with the extracellular fluid and in this way exert control on the neuronal environment. It has since been shown that glucose, amino acids, and ions ...

Glia, also called glial cells or neuroglia, are non-neuronal cells in the central nervous system (brain and spinal cord) and the peripheral nervous system that do not produce electrical impulses. They maintain homeostasis, form myelin, and provide support and protection for neurons. In the central nervous system, glial cells include oligodendrocytes, astrocytes, ependymal cells, and microglia ...

Neuroglia of the PNS. Neuroglia in the PNS include Schwann cells and satellite cells. Schwann cells are similar in function to oligodendrocytes and microglial cells, providing myelination to axons in the PNS. They also have phagocytotic activity and clear cellular debris that allows for regrowth of PNS neurons.

L. Jennes, in Conn's Translational Neuroscience, 2017. Neuroglia. Neuroglia cells represent the most numerous cell family in the central nervous system with 5-10 glial cells per neuron or 350 billion cells per brain. Glial cells retain their ability to divide; provide metabolic and structural support for neurons, and maintain conditions that allow adequate functioning of neurons.

Neuroglia: Function & Definition - Video & Lesson ...

Neuroglia are also called glia or glial cells. Their job is to support the neurons to send signals quickly and efficiently. There are two kinds of glia in the peripheral nervous system and four kinds of glia in the central nervous system. Each of the six types of neuroglia have a different function.

Neuroglial cells—usually referred to simply as glial cells or glia—are quite different from nerve cells. The major distinction is that glia do not participate directly in synaptic interactions and electrical signaling, although their supportive functions help define synaptic contacts and maintain the signaling abilities of neurons. Glia are more numerous than nerve cells in the brain ...

Neuroglia (glia) are cells that support and protect neurons. The following four neuroglia are found in the CNS: Astrocytes have numerous processes that give the cell a star-shaped appearance. Astrocytes maintain the ion balance around neurons and control the exchange of materials between blood vessels and neurons.
